

ACO AVT 100

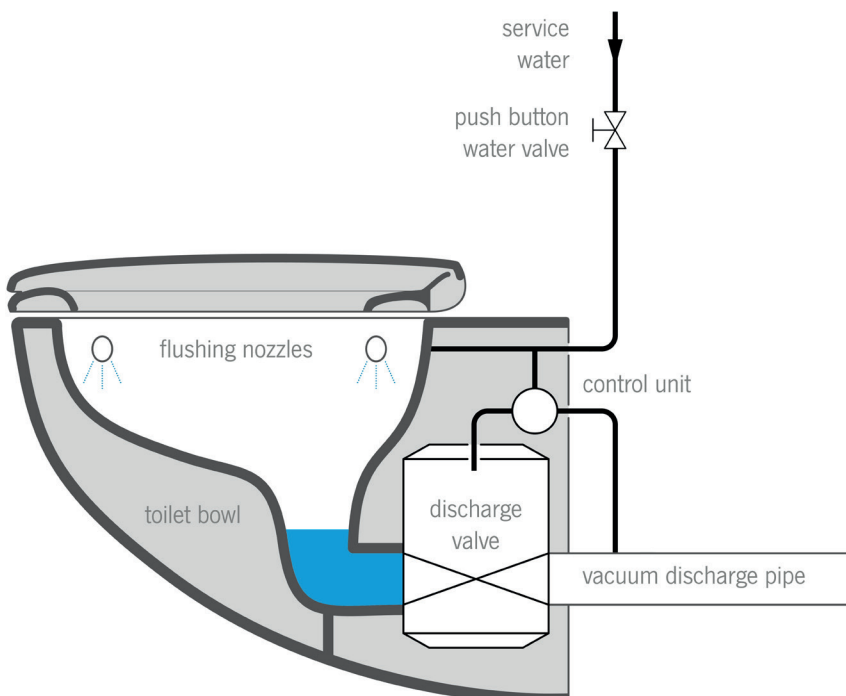

The hydraulic variant of vacuum toilet – ACO AVT 100, has been designed to meet market demand from the commercial merchant ship market, due in part to its low cost and reduced maintenance requirement.

Compared to existing vacuum toilets, the ACO AVT 100 design uses unique operating and control arrangements. Each toilet has fewer components than existing units, operating instead with a patent-protected self-closing/opening pressure valve for direct flushing.

This significantly improves maintenance schedules and reduces operational costs whilst at the same providing consistent and reliable flushing performance during high-demand periods on board ship.
